

## **CME Release Version 1.10 Firmware for U-Key Keyboard**

CME has announced latest version 1.10 firmware for their U-Key keyboard.

The CME U-Key Mobiletone keyboard has ultra-slim, full-action semi-weighted keys with a built-in, 64-polyphony high-quality sound module, and an internal high-fidelity speaker driven by a digital amplifier. It contains several MIDI songs and accompaniments in different styles, including loop variations and chord changes produced by professional musicians that are initiated by the U-Key's unique PadStyle.

The CME U-Key comes with more than 20 user-defined controllers, including a joystick, trigger pads, an encoder for data entry, and pedals. All controllers are fully-programmable and each function can be easily set up and saved for later loading by pressing certain keys. USB powered and compatible with both Windows XP and Mac OSX, it's a great solution for composing on laptops.

The major changes of the U-Key v1.10 firmware compared with the produced units are:

- New velocity curves for drum pads.
- Fixes known bugs and glitches.
- Improved system stability.

The full update will be free of charge. Users can download it from CME website and select relevant model to upgrade.
